

# O-Shaped Mount

Fig. 1 O-Shaped Mount

## Product description

O-shaped mounts have a very soft spring characteristic and are therefore commonly referred to as low-frequency mounts.

## Product advantages

- Reduced transmission of structure-borne noise
- Compact
- Deformable in various planes
- Easily installed
- RoHS-compliant.

## Application

O-shaped mounts are of a design that enables good vibration insulation for the loads that typically occur in instrumentation and control applications.

## Material

Standard material	Hardness
Natural rubber NR 11	40, 45, 60 Shore A
Acrylonitrile-butadiene rubber NBR 68	60 Shore A
Ethylene-propylene rubber EPDM 22	60 Shore A

## Operating conditions

<b>Axial forces</b>	20 N ... 215 N	Maximum permissible force
<b>Max. temperature</b>	up to +60 °C transient up to +80 °C for NR 11	
<b>Min. temperature</b>	-45 °C for NR 11	

Fig. 2 Primary load directions

The spring characteristic of the O-shaped mount increases in the order X,Y and Z, whereby depending on the orientation, an optimal vibration insulation can be achieved. The primary load direction is the longitudinal axis of the threaded studs (Z direction).

## Design notes

The component consists of a ring-shaped elastomer body with each flat vulcanised to securing plates with screws.

## Fitting & installation

- Individual components permit slight adjustment to allow for in-situ offset
- The form of the boreholes to accommodate the threaded studs must be compliant with DIN EN 20273
- The securing plates must be in full-surface contact with the mating faces.
